Github forked repository https://github.com/sonicspeed123/CS472

Various source files were tracked for the above graph. These include files in the app/src/main directory and the rootbeerlib/src/main/ file directory. All other files and directories where not taken into consideration for this graph.

According to the graph, the most files that were committed in a single day was near the beginning of the project. Most of the flies rarely had any updates.

It seems that the person who added the most files in a single day did not do much more work until the end of the current timeline.

It seems that the files that were collaborated on by the most people were .java and .so files in the rootbeerlib/src/main directories, of which many were labeled as test files.

It seems that rootbeer.java was the most changed file in the entire repository.

Various source files were only ever changed twice during the project.

During this lab, the most useful git commands to me have been:
Git commit
Git branch
Git checkout
Git push
Git add
